

MEAS TEMPERATURE SYSTEMS SENSOR (TSYS02D) DIGITAL COMPONENT SENSOR (DCS) DRIVER FOR MicroZed

Digital Temperature Sensor Software Development Kit

Detailed example software and drivers are available that execute directly, without modification, on a number of development boards that support an integrated or synthesized microprocessor. The download contains several source files intended to accelerate customer evaluation and design. The source code is written in standard ANSI C format, and all development documentation including theory/operation, register description, and function prototypes are documented in the interface file.

Specifications

- ◆ Measures temperature from -40°C to 125°C
- ◆ I²C communication
- ◆ Fully calibrated
- ◆ Fast response time
- ◆ Very low power consumption

Reference Material

- Detailed information regarding operation of the IC: [TSYS02D Datasheet](#)
- Detailed information regarding the Peripheral Module: [TSYS02D Peripheral Module](#)
- Complete software sensor evaluation kit for MicroZed: [TSYS02D_MicroZed.zip](#)

Drivers & Software

Detailed example software and drivers are available that execute directly, without modification, on a number of development boards that support an integrated or synthesized microprocessor. The download contains several source files intended to accelerate customer evaluation and design. The source code is written in standard ANSI C format, and all development documentation including theory/operation, register description, and function prototypes are documented in the interface file.

Functions Summary

| Enumerations | |
|-------------------------------|---|
| enum | tsys02d_status { tsys02d_status_ok , tsys02d_status_i2c_transfer_error , tsys02d_status_crc_error } |
| Functions | |
| void | tsys02d_init (u32) Initializes the AXI address of the AXI IIC Core |
| enum tsys02d_status | tsys02d_reset (void) Sends the I ² C reset command to the TSYS02D device. |
| enum tsys02d_status | tsys02d_read_serial_number (void) Read serial number values from PROM and perform CRC check on the data for accuracy |
| enum tsys02d_status | tsys02d_read_temperature (float *) Reads the temperature ADC value and computes the compensated value in degrees Celsius. |

Project Setup

This project is based on the MicroZed board with I/O carrier card. The FPGA hardware and the console application will be loaded via micro SD card.

You will need:

- MicroZed board
- I/O carrier card
- TSYS02D sensor for Digilent Pmod™ board
- Micro SD card
- I/O carrier card power adapter
- USB-to-MicroUSB cable for UART communications
- A computer with a card reader to write to the SD card and to host a terminal emulator

The following steps will guide you through setting up the hardware platform:

1. First, if you have not connected your computer to a ZedBoard or MicroZed device before, you will likely need to download and install the Silicon Labs CP2104 USB-to_UART driver. The setup guide for installing the driver can be found at the address below: http://www.zedboard.org/sites/default/files/documentations/CP210x_Setup_Guide_1_2.pdf

MEAS TSYS01 DCS FOR MicroZed

Digital Temperature Sensor

- Next, attach the SD card to your computer via a card reader or through the built-in SD card slot. Download the “boot.bin” file that pertains to the TSYS01 from the software link and copy it onto the SD card so that it is the only file present on the file system.

- Safely eject the micro SD card from your computer. Insert the micro SD card into the card slot on the back of the MicroZed board.

- Carefully line up the MicroZed board with the I/O carrier card and push them together until snug.

MicroZed and Digilent Pmod™ are trademarks.

MEAS TSYS01 DCS FOR MicroZed

Digital Temperature Sensor

- Connect the TSYS02D digital temperature sensor to the “JC” Digilent Pmod™ port of the I/O carrier card, ensure that jumpers J1, J2, and J3 are configured such that the MicroZed will boot from the SD card on start up, and connect the power adapter to the barrel jack on the I/O carrier card (shown on the bottom). Finally connect the micro-USB cable to the micro-USB port of the MicroZed (shown at the top). The USB cable will facilitate UART transmissions for the console application.

- Turn on the power to the board with the switch next to the barrel jack. When the board powers up, the MicroZed will briefly illuminate a red LED, which will then turn off after less than a second. Once the FPGA has been successfully programmed by the boot image on the SD card, a blue “Done” LED will illuminate on both the MicroZed and the I/O carrier card. Your hardware should appear as shown below. If the board was powered on before this step, turn the power off and repeat this step.

Launching the Console Application

Now that you have successfully set up your hardware platform, you are ready to run the console application.

- Upon power-on, the console application should already be running. It will be necessary to open a terminal and configure a serial connection to interact with the console application. Do this by opening Tera Term or a similar terminal emulation software package.
- Tera Term may display an error when it starts up if it tries to connect to a COM port where no device is present. It is safe to ignore this warning, so click OK. Next, open the “Setup” menu and click the “Serial Port...” option.
- Now select the appropriate COM port that your MicroZed setup is connected to. If you are not sure which this is, refer to the Device Manager. Configure your serial connection with 115200 Baud, 8 bit data, no parity, 1 stop bit, and no flow control, and then click OK.

MicroZed and Digilent Pmod™ are trademarks.

4. You should now have a live connection open to the console application running on the MicroZed. Press enter and the console application will display the main menu from which you can perform several tasks on the TSYS01 Digital Temperature sensor.

TSYS02D - Digital Temperature Sensor
-----
Select a task:
(1) - Reset
(2) - Read Serial Number
(3) - Read Temperature Once
(4) - Read Temperature 20 Times
<ESC> - Quit
```

Running the Console Application

The console application is intended to demonstrate the required operations when using the sensor.

- a. After startup, it is a good idea to reset the sensor. This puts it in a known state. Do this by selecting (1) in the console application.
- b. Each sensor is given a serial number that can be read from PROM. The data is CRC checked as it is read in and stored in a global variable. Read the device serial number by selecting (2) in the console application.

Now the sensor and the software are setup. These first two steps only need to be performed once at power up.

- c. The console application option (3) reads the temperature once.
- d. The console application option (4) reads the temperature 20 times at approximately two measurements per second and displays them to the screen in real time.

Application Code

This section is intended to provide a basic example of functionality.
